

Use and Maintenance Instructions

Step 1 - Separate the top and bottom halves by pushing them in opposite directions (A). Then lift the top up (B) to disengage the hook latches. The circuit is now completely disabled and everything is safe to handle without risk of shock.

Note: This cover should not be removed under any circumstances. Removal of cover will void warranty

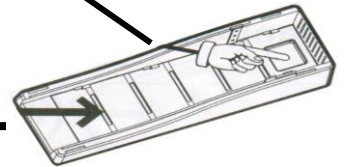

Step 2- Push tab with finger and remove battery compartment door. Install four D size alkaline batteries as shown.

Step 3- Place a small amount of

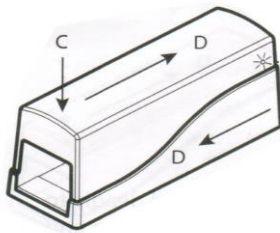

dry dog or cat food in the bait cup.

Note: Remove any leaves, debris, rodent feces or urine from the kill plate. It is OK to wash with water if necessary. Allow to dry before re-assembling

Step 4 - Replace top part by lowering the hooks into the slots (C) and then sliding the top and bottom together (D) immediately. You will see the indicator lights illuminate. Here is what they mean:

◆ **Red and Green light Flash:** The battery power is insufficient to do a kill cycle. Replace the batteries.

◆ **Green light Flash:** The kill plate has some debris on it. Remove the top and clean the kill plate.

◆ **Red light Flash :** Batteries are good. Kill plate is clean and everything is ready to go!

◆ **Red light on:** keep for 4 minutes, the unit emits high voltage shock.

Step 5 - Once you have a **Red flashing light**, you are ready to place your trap in the desired location. Place your trap in a location of known rodent activity. Rodents have very strong habits and will follow the same path day after day. They like the safety of the edges, corners and tight covered spaces. Place the trap in a space that a rodent would like to be in—not one YOU would like to be in. You can help ensure success by doing the following:

- Remove any other food source. Make sure that the bait inside your trap is the **ONLY** food in the area.
- Be patient! Rats are especially wary of new things. It will take time for them to trust going into the trap. With their excellent sense of smell, they will detect your scent for days and be very cautious. Don't disturb the trap—just visually inspect it every so often to see if the **Green indicator** lights are blinking. If they are, you have caught one!
- Only clean your trap if it is especially dirty and/or the yellow light is showing. The smell of other rodents—dead or alive—will actually attract others to come visit. Wash with water only. Strong smelling soaps and cleansers will linger on the trap and keep rodents away.

Reset - To reset your trap after a kill, repeat **Steps 1, 3, 4 and 5**.
